GEOMETRY

● What is Point?

Point is the basic unit of Geometry.

● For Example:

• X

• A

• B

● Read: point **A**, point **B**, point **X**

● Real-life Example: Point

● Example: Map

Location of any address on a map is a point.

● What is Line Segment?

A line segment is the straight path between two points.

● For Example:

D ————— E

● Read: Line segment **DE** or **ED**.

Real-life Example: Line Segment

- Example: Edges of an eraser or a ruler.

What is Line?

Line is a set of points that extends forever in opposite directions.

For Example:

- Read: Line $\overleftrightarrow{GH}$ or line $\overleftrightarrow{HG}$

What is Ray?

A ray is the part of a line that has a starting point and goes on forever in one direction.

- For Example:

- Read: Ray $\overrightarrow{KJ}$

- **Real-life Example: Ray**

- **Example:** Sunrays and flashlight.

- **Write each as point, line, ray or line segment.**

• Draw the following.

1) A line

2) A ray

3) A line segment

● **Choose the correct option.**

1) Which of these figures is a line segment?

2) Which of the following is a line?

3) Which of these figures is a ray?

4) Which of the following is a line segment?

5) Which of the following is a ray?

6) Which of these figures is a line?

- Tick the line segments and cross the rays. Also encircle the points in each figure.

● Quadrilateral

A quadrilateral is a four-sided polygon with four angles. There are various types of quadrilaterals, each with unique properties based on their side lengths and angle measurements.

Rectangle: A quadrilateral with four right angles. Opposite sides are parallel and equal in length.

Parallelogram: A quadrilateral where opposite sides are parallel and equal in length.

Trapezoid: A quadrilateral with one pair of parallel sides.

Square: A special type of rectangle where all sides are equal in length and each angle is a right angle.

Rhombus: A parallelogram with all sides of equal length, making it a type of equilateral quadrilateral.

• Match the quadrilateral with its definition.

Rectangle •

- There is only one pair of parallel sides.

Parallelo-gram •

- All sides are the same length.
- There are four right angles.

Trapezoid •

- There are two pairs parallel sides. All sides are the same length.

Square •

- Opposite sides are parallel and the same length. There are four right angles.

Rhom-bus •

- There are two pairs of opposite parallel sides.

• Name the following quadrilaterals.

1)

2)

4)

3)

5)

6)

• Name each quadrilateral below.

1)

2)

3)

4)

5)

6)

7)

8)

9)

10)

11)

12)

● Circle

A circle is a perfectly round shape where every point on the edge has the same distance from the centre.

Radius: The radius is the distance from the centre of the circle to any point on its edge.

Diameter: The diameter is a line that goes across the circle, passing through the centre, and is twice the **radius**.

● **Measure the radius and diameter.**

Radius: _____
Diameter: _____

Radius: _____
Diameter: _____

Radius: _____
Diameter: _____

Radius: _____
Diameter: _____

Radius: _____
Diameter: _____

Radius: _____
Diameter: _____

Radius: _____
Diameter: _____

Radius: _____
Diameter: _____

Radius: _____
Diameter: _____

You did it! You have mastered new maths skills like numbers, shapes, and patterns. Maths is like a superpower that helps you everywhere you go. Keep practising and see how much more you can achieve!
