FUNDAMENTAL CONCEPTS OF GEOMETRY

● What is Angle?

Two rays having a common endpoint are called an angle.

● For Example:

● Definition of length:

The measurement or extent of something from end to end.

● Definition of Vertex:

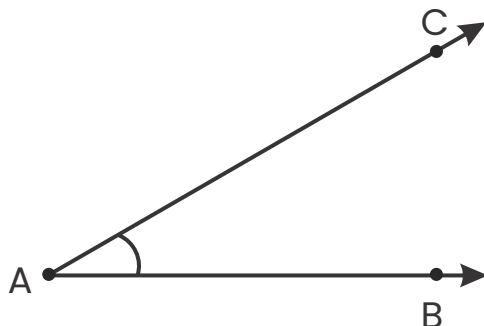

A vertex is a point where two straight lines or rays meet.

● Definition of Arms:

The two sides of the angle, joined at a common endpoint.

● Definition of Right angle:

When two straight lines intersect each other at 90 or are perpendicular to each other at the intersection.

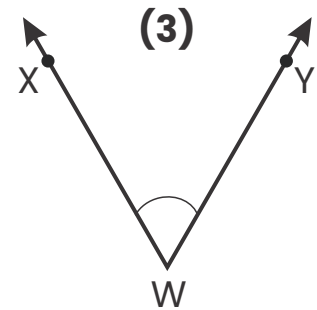

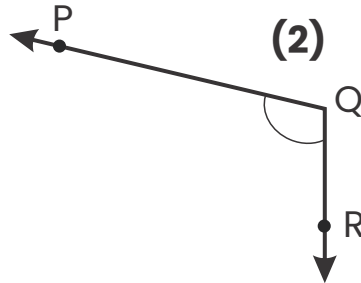

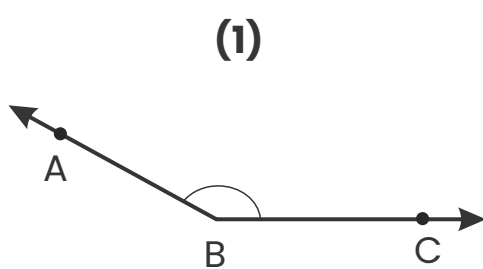

Read: angle A angle CAB
 angle BAC

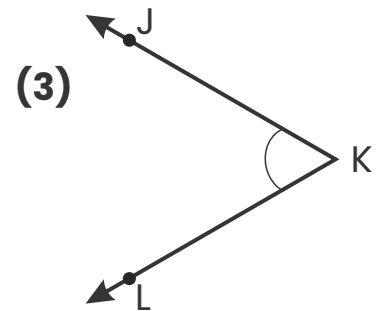

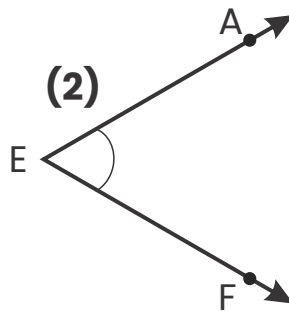

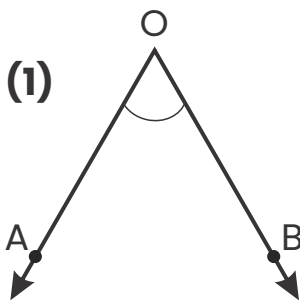

Write: $\angle A$ or $\angle CAB$ $\angle BAC$

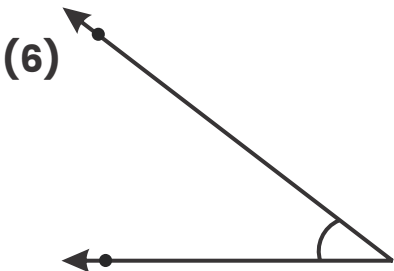

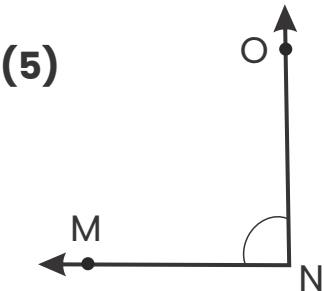

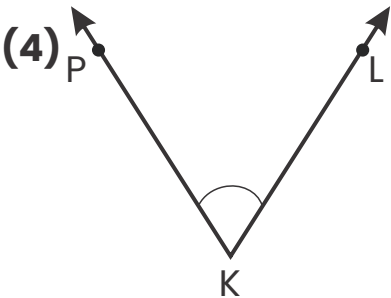

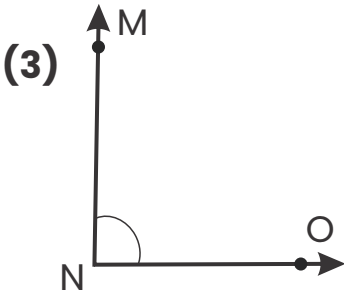

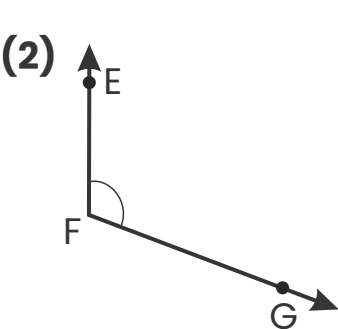

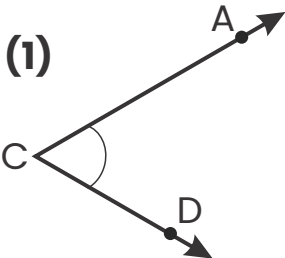

- Write the names of vertex and arms of each of the following angles.

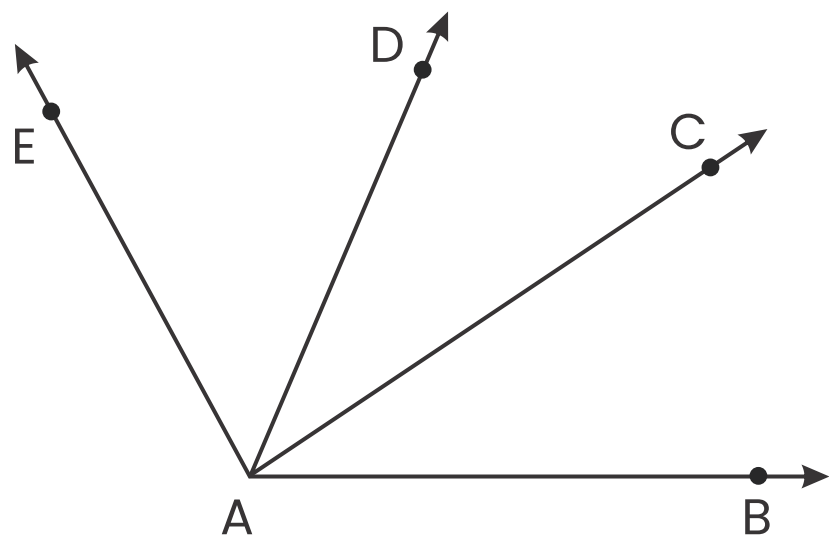

- Write the following angles in symbols.

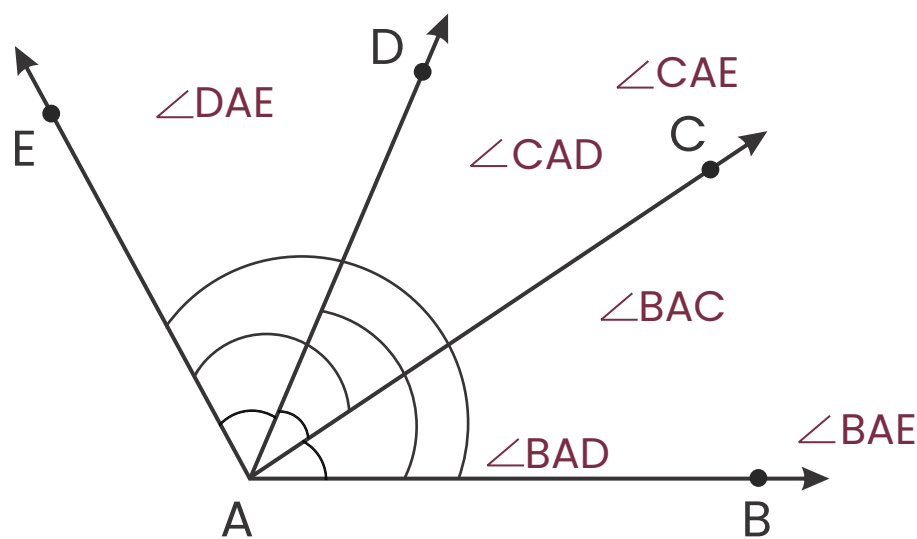

- Look at the following angles and tick all those that are right angles.

• How many angles are formed in this figure?

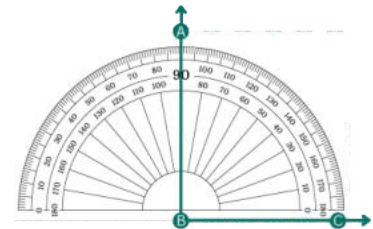

• How many angles are formed in this figure?

• Types of Angles

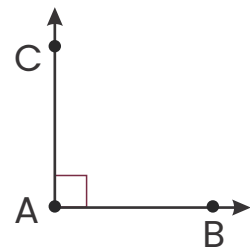

• Measuring Angles

You can measure angles in degrees ($^{\circ}$) using a protractor.

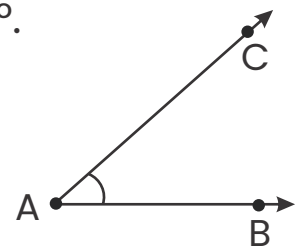

• Right Angle

Measure of a right angle is 90° .

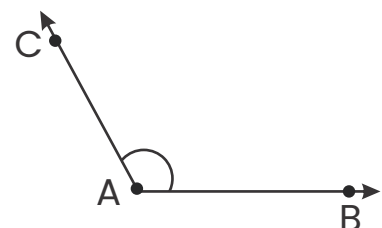

• Acute Angle

Measure of an acute angle is less than 90° .

• Obtuse Angle

Measure of an obtuse angle is more than 90° but less than 180° .

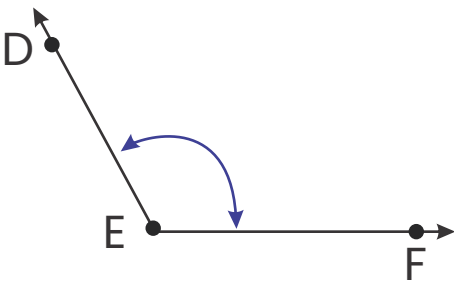

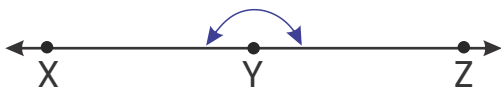

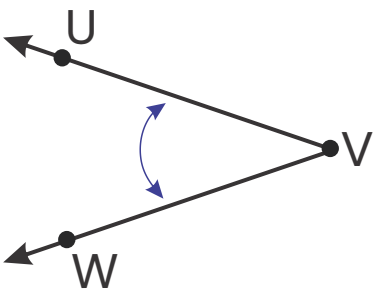

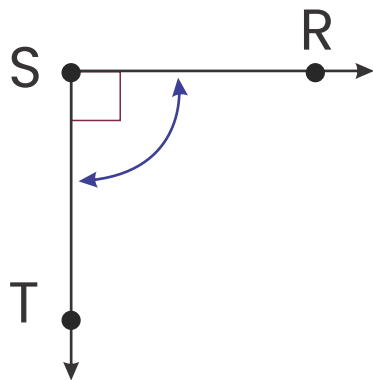

• Straight Angle

Measure of a straight angle is 180° .

- State whether the angle is right, acute, obtuse, or straight.

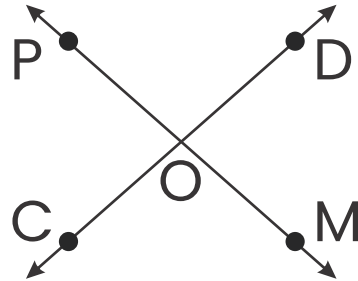

- Which of the following figure shows right angles?

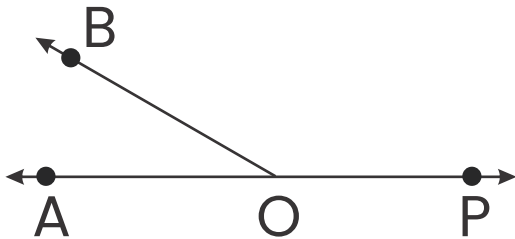

(1)

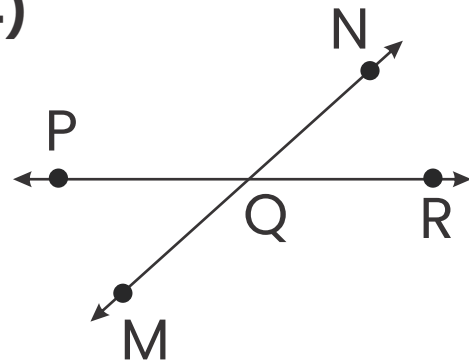

(2)

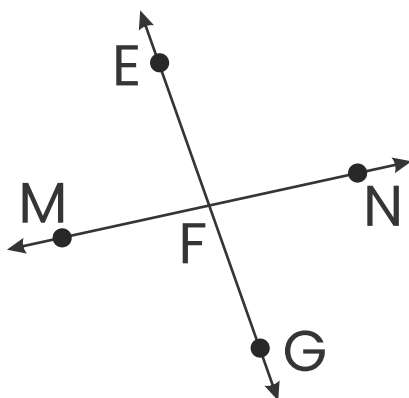

(3)

(4)

(5)

(6)
